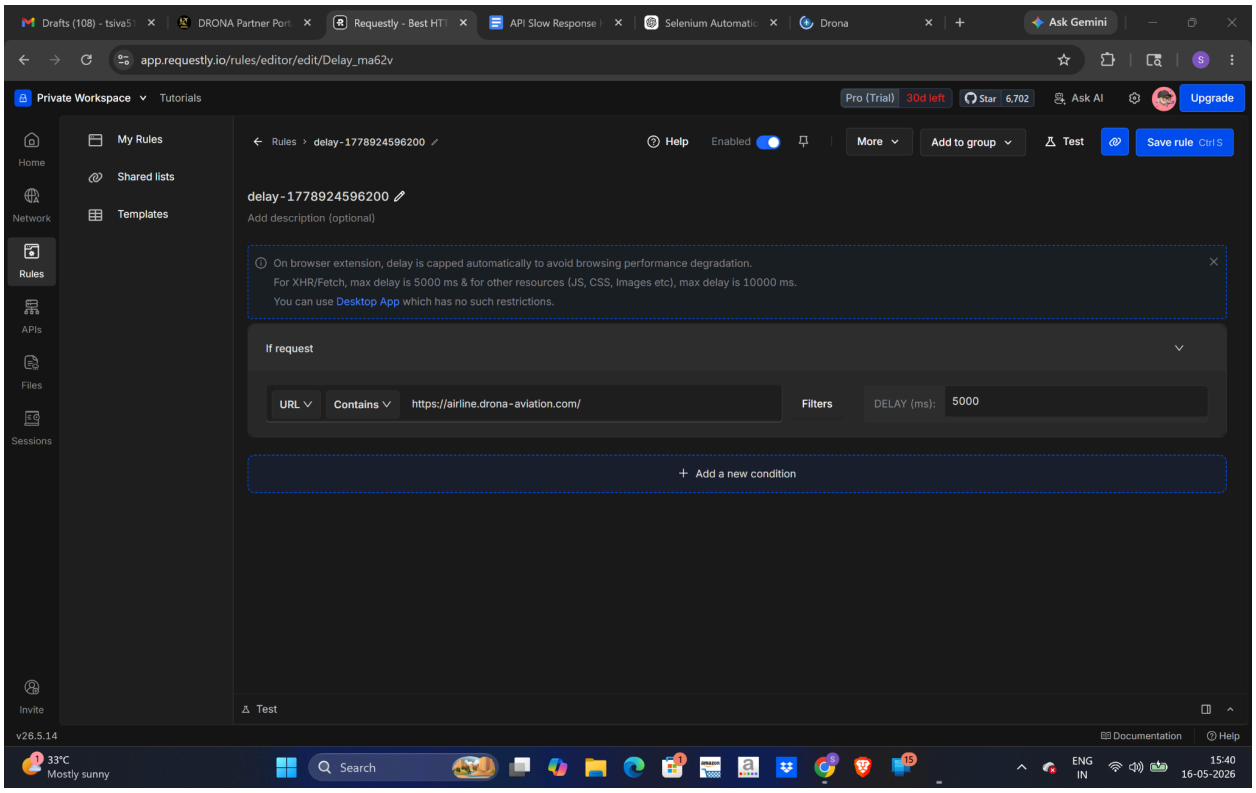
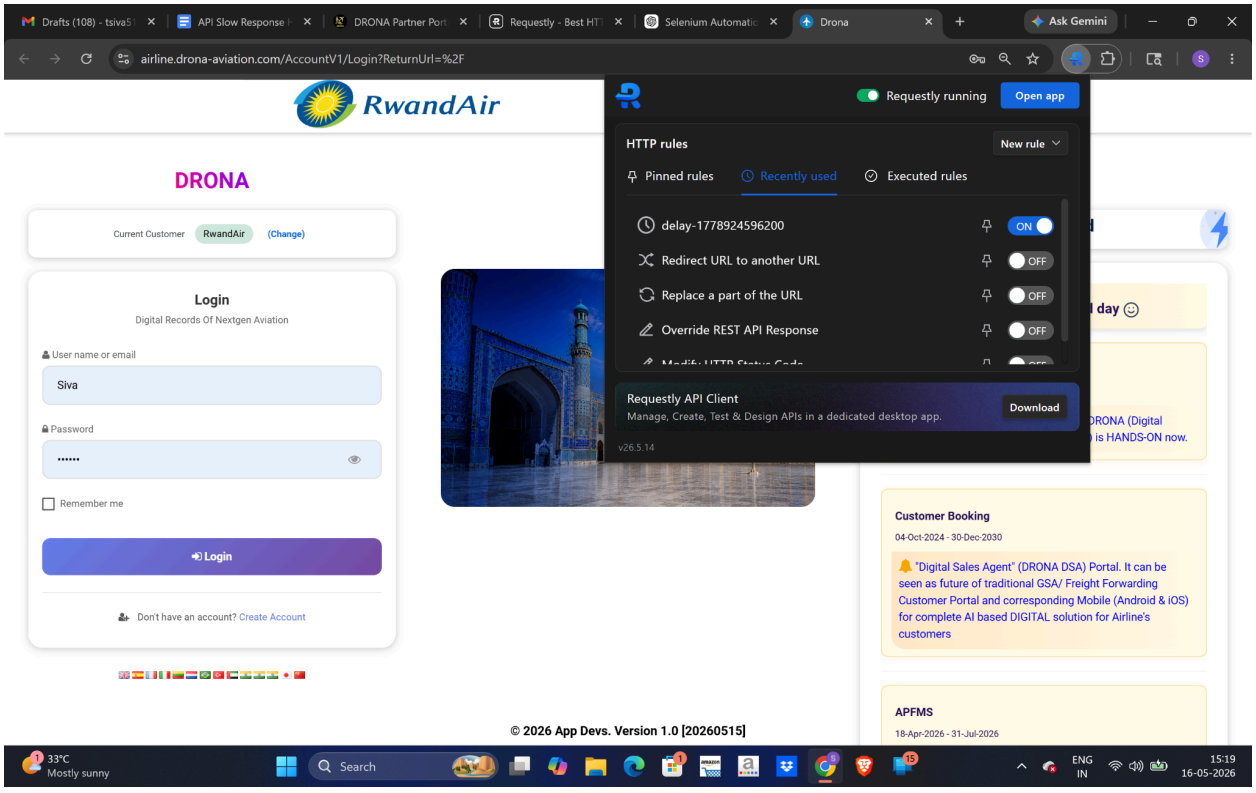
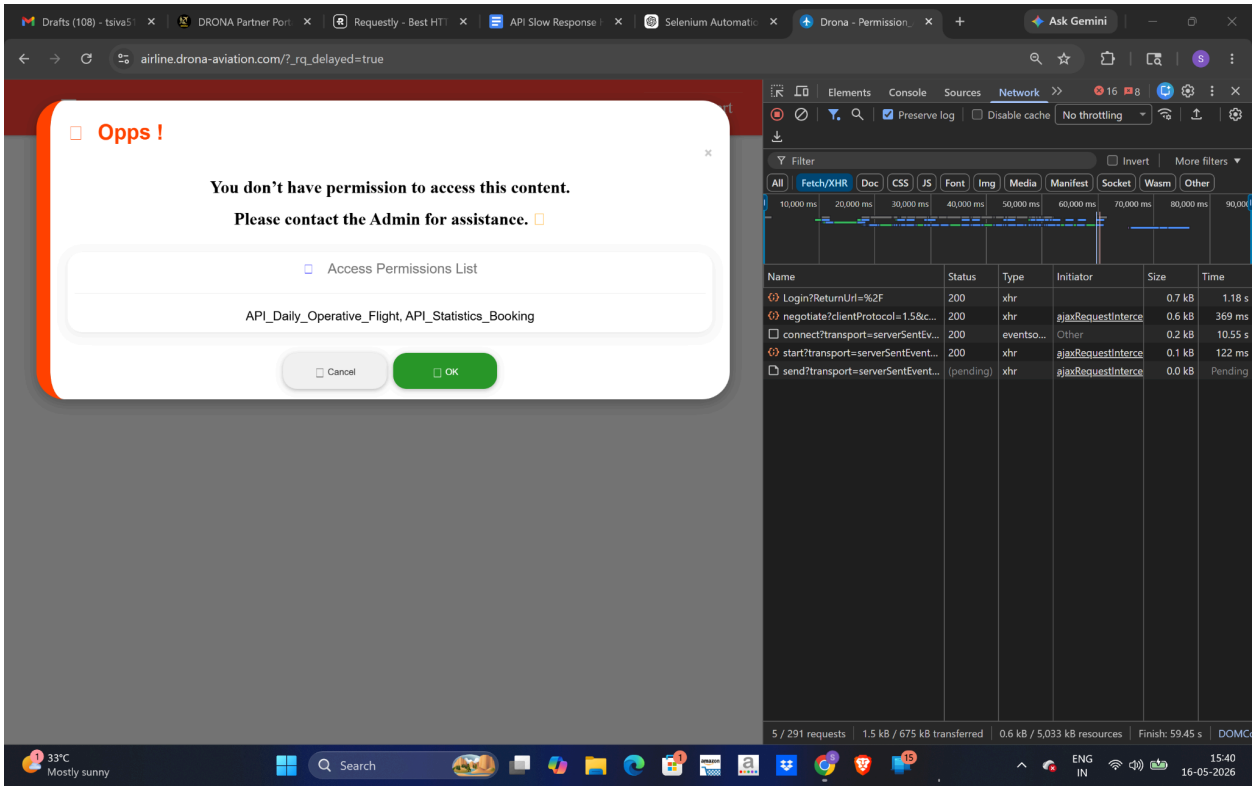
API Slow Response Handling — Login API







Slow API response simulation was performed using the Requestly browser extension by introducing artificial delay rules for login-related API requests.

Test Configuration:
- Tool Used: Requestly
- Delay Applied: 5000 ms
- Target API: Login / AccountV1 related requests

Test Scenario:
1. Delay rule was enabled in Requestly.
2. User login operation was executed.
3. Network requests were monitored using Chrome DevTools.
4. Application behavior under delayed API response conditions was validated.

Observations:
- Login API responses were delayed successfully.
- The application continued functioning without crashes.
- Loading and response handling remained stable.
- HTTP Status 200 responses were received.
- No critical frontend exceptions were observed.
- Slow network simulation was successfully reproduced.

Result:
The application demonstrated acceptable handling of delayed API responses under simulated slow-network conditions.
